

Product Sustainability Icons Statement

At Innospec, we are committed to communicating the sustainability-related performance attributes of our products in a clear, accurate, and transparent manner. The icons used on our sustainability website have been designed to illustrate the potential sustainability benefits that our customers may be able to achieve using our chemical additives.

These icons are based on specific field trial results, laboratory studies, or experimental data carried out under controlled conditions using Innospec formulations. The performance outcomes shown therefore reflect benefits demonstrated only within the defined parameters of these tests and should not be interpreted as guarantees of performance in actual operating conditions.

We do not include specific quantitative performance measurements directly on product sheets because these values are highly dependent on the precise test conditions, including fuel type, engine platform, operating environment, and application method. Providing numerical values without this full context could be misleading or open to misinterpretation. Performance data is therefore best reviewed directly with customers, allowing us to explain the test conditions, assumptions, and relevance to their own operating environment.

Some detailed performance data is considered commercially sensitive. While we choose not to publish these figures broadly, we make it available to customers through controlled sharing and technical discussions under a non-disclosure agreement when deemed necessary. Our Customer Technical Service team can provide full details, supporting evidence, and test methodology where appropriate.

Because real-world operating conditions vary, actual outcomes will depend on numerous factors, including formulation compatibility, equipment characteristics, and dosage application. We therefore encourage customers to contact our Customer Technical Service team for tailored guidance and to develop an understanding of how the observed test results may relate to their specific application and local regulatory requirements.

Innospec remains committed to responsible, transparent communication and continues to ensure that all sustainability-related product information aligns with regulatory expectations and industry best practice.
